MCP - Assignment 1

Q3. Assess the environmental condⁿ of PUNE by examining any two major environmental challenges

→ Let's be honest environmental challenges aren't that big of challenge (rain) the poor infrasture of Pune causes multiple issues. During heavy rain its more about the profound infrastructure failures. The ongoing rain have exposed the fragility of Punes urban planning, highlighting two major challenges: severe urban flooding due to compromised water bodies & the paradoxical mismanagement of ground water resources.

→ The first major challenge: Urban flooding, the city utilized a network of natural streams (nullahs) to channel excess rainwater into the Mulla / Mutha rivers, Todays, rampant concretization, unauthorized construction along river banks, & poorly designed retaining walls have drastically reduced the natural carrying capacity of these waterways, furthermore, the municipal stormwater drainage infrastructure is antiquated, due to this roads transform into small rivers, due to the the Earth is turning into the moon. (potholes as big as 5m on a normal road)
Due to the poorly managed system and infrastructure the drainage water leaks into normal causing contamination, because of this expansion for mosquitoes breeding can cause diseases like dengue etc.

→ Second major challenge: The blame

The Government will blame the harsh/heavy rain for floods, Dirty/muddy water, damage to a person's private property, But who is at fault? The answer is simple the government for providing such shit development / infrastructure, giving unauthorized permits to build buildings etc, this is done by accepting bribes which leads to corruption.

Main cause? due to the corruption it affects the overall balance by cutting down large amount of the nature (land, trees etc) which further causes heat a normal $25^{\circ}-30^{\circ}$ in summer to $45^{\circ}-50^{\circ}$ in the past 8 years. Which causes delaying in ^{the} monsoon season, heavy rain.

Consequently, once the monsoon retreats, many residential societies find themselves heavily reliant on private, unregulated water tankers to meet their basic daily needs, it presents a significant public health risk, as the quality & safety of tanker water are frequently unverified & prone to contamination.

→ In conclusion, assessing punes current environmental condⁿ requires looking beyond the weather. The severe impacts on public health are the direct results of failing to protect natural water bodies & build ^sreilient urban infrastructure, this requires urgent infra^t hauls, the restoration of natural drainage system, & commitment to civic sense, civic engineering & stop corruption.

qs. Management - Employee conflict & systematic exploitation in PUNE IT sector.

→ A case occurred in mid-2026 involving Thynktech India, an IT firm operating out of Pune's prominent Hinjewadi phase II tech park. In this major inter-group conflict, over 500 software engineers, fresh graduates, & interns were abruptly rendered jobless when executive management [^] shutdown the divisional branch without any prior notice. The conflict reached a breaking point when employees discovered the rented office premises were permanently locked due to unpaid rent & the CEO & HR became unreachable, what happened is severe structural exploitation, financial malpractice & a complete breach of employer-employee trust, moving far beyond Employee trust. What primarily caused this was a financial mismanagement with deceptive hiring practices. However the root of the conflict began in Feb-26 when routine salary & stipend disbursements were delayed, the Management lied by attributing the delayed payments to pending "internal financial & administrative processes." Another unethical for the conflict was the company's policy of demanding a ₹15000 security deposit from newly hired interns under the guise of whom were already struggling to meet their daily household expenses & rent in pune.

//_

The massive asymmetry between desperate young professionals seeking a job in the competitive market & an authoritative management team allowed this exploitation to happen, the massive collapse eventually led to police intervention & the detainment of the CEO.

To prevent such malpractice & build an environment that can genuinely improve teamwork & productivity, the IT sector must adopt strict zero tolerance policies regarding employee financial exploitation, that companies are legally prohibited that companies cannot demand any form of upfront security deposit for essential work equipment.

Second, the industry requires proactive early stage intervention mechanism, Employees must engage with NIETs or dedicated IT sector labor tribunal at the very first instance of structural anomalies, such as delayed salary. Early intervention forces management into structured conciliation before a total corporate collapse occurs.

It firms must implement transparency if a company faces genuine economic hardship, transparent communication is far more effective than deception, Honest communication preserves mutual respect & allows employees to make decisions, transforming a criminal dispute into a manageable corporate transition.
